

COVID-19 vaccines: Get the facts

6 COVID-19 vaccine facts you need to know

Fact No. 1

A COVID-19 vaccine will not give you COVID-19.

A COVID-19 vaccine does not contain any part of the virus and cannot cause an infection or positive result on a viral test.

Fact No. 2

Quick development of a COVID-19 vaccine does not mean that it is not safe.

Significant scientific progress decades before the pandemic, in addition to collaboration among scientists around the world, made rapid development possible.

Fact No. 3

A COVID-19 vaccine may provide protection against more than one strain.

Like all viruses, SARS-CoV-2 – the virus that causes COVID-19 – develops small mutations over time. Information to date shows that the COVID-19 vaccines are effective against multiple strains currently in circulation.

Fact No. 4

A COVID-19 vaccine will not change your DNA.

Two COVID-19 vaccines are mRNA vaccines, which do not interact with DNA in any way. They trigger an immune response that produces antibodies, which protect you from getting infected.

Fact No. 5

A COVID-19 vaccine has not been linked to infertility or miscarriage.

There is no evidence that a COVID-19 vaccine causes infertility or increases your chances of a miscarriage. In addition, the natural post-infection immune response to COVID-19, which the vaccine mimics, has not resulted in an increase in miscarriages or infertility.

Fact No. 6

We know exactly what is in a COVID-19 vaccine.

Pfizer, modern and Johnson & Johnson have published the ingredient lists for their COVID-19 vaccines. Speculation that either contains microchips or tracking devices has been proven false.
